

## ***Frequently Asked Questions***

**Title:** Running multiple applications using same copy of DLLs

**Date:** March 2020

**Card/Board/Module:** All

**Operating System:** Windows

### **Question:**

Can I run multiple applications of some protocol, using a single copy of the required DLLs ?

### **Answer:**

You can run multiple applications simultaneously for any specific protocol, using a single set of DLLs (for that protocol).

For example, for multiple 1553Px modules, you can run demo\_bc\_general on module 0, demo\_rt\_general on module 1, demo\_mon on module 2, demo\_loopback on module 3 - all at the same time, simultaneously.

You can run only one application on a specific module at a time.

You can run different applications (or even the same application) on different modules at the same time. For example, you can run multiple copies of MerlinPlus or Mystic on different cards (one copy can run on all the modules of a single card).
